

User Stories

AUSTRALIAN TRADIE AI ADMIN MVP

Based on business_context.md, Replit MVP direction, and current brand kit

Purpose

This PDF turns the user-story analysis into a practical product-planning artifact for an Australian tradie-focused AI admin MVP. It keeps the app name flexible and uses TradieMate only as the working title.

Evidence Standard

- No fake customer quotes, fake research, or inflated claims.
- Clear separation between confirmed evidence, reasonable inference, and unvalidated assumptions.
- MVP focus: validate painful, frequent, commercially meaningful admin workflows before building more.

Strategic Product Angle

Speak once, clear your admin faster. The strongest MVP is not generic AI for tradies. It is field-first voice capture that turns job/admin information into tasks, follow-ups, reports, and customer messages.

Source Context

The supplied business context positions the app as an AI-powered, voice-first admin platform built as a mobile-friendly PWA for Australian tradie businesses. Core directions include AI voice quoting, voice site reports with photos, client follow-up, missed-call handling, and task management.

The ICP is Australian tradie business owners and sole traders across trade verticals, especially 1-5 person operations that are time-poor, admin-averse, miss calls while on-site, and quote through memory, text message, or rough paper.

Evidence Anchors

Source	Evidence used in this document
ABS	Construction accounted for 7.0% of Australian GDP in 2023-24 and employed around 1.3 million people.
ASBFEO	Most Australian businesses are small; many are self-employed or 1-4 employee businesses.
AMP	Financial admin is a substantial time burden for Australian small business owners.
Xero Small Business Insights	Late invoice payment remains a cash-flow issue for Australian small businesses.
ServiceM8 / Tradify / AroFlo	Competitor positioning validates quoting, scheduling, job tracking, notes/photos, invoicing, payments, and field-office workflows as established trade software categories.

Scoring Key

Scores are from 1 to 5. For technical complexity, 1 means easy and 5 means high complexity. Overall priority balances pain, frequency, willingness to pay, MVP fit, market relevance, and risk.

1. Voice note to quote draft after a site visit

As a solo plumber, I want to speak the job details into my phone after inspecting a site, so that I can create a quote draft before I forget the details.

User Persona

Persona Field	Details
Trade type	Residential plumber
Business size	Solo operator
Location / context	Western Sydney or outer Melbourne suburbs, driving between small jobs
Daily workflow	Takes calls, attends jobs, inspects leaks/blockages, quotes after hours
Admin / tech comfort	Comfortable with phone, SMS, and photos; not keen on complex software
Current pain point	Forgets quote details or delays quotes until night

Problem Being Solved

The operational problem is not AI quoting by itself. It is quote delay and memory loss. The tradie inspects the job, gets back in the ute, moves to the next job, and by night the details are fuzzy. A quote that could have been sent same-day becomes delayed or rough.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Trade job-management platforms compete around quoting, job notes, invoices, and paperwork reduction. ServiceM8, Tradify, and AroFlo all validate the job/quote/admin workflow category.
Reasonable inference	If established platforms emphasise quote/job workflows, quoting admin is a validated workflow category.
Unvalidated assumption	Tradies will prefer voice-first quote capture over current notes, SMS, or memory workflows.

Current Workaround

Phone notes, SMS to self, photos in camera roll, memory, paper notebook, later typing quote into Xero/MYOB/Tradify/ServiceM8, or sending a rough text message.

MVP Feature Connection

Support through New Site Note -> transcript/photos -> Gemini AI output -> quote draft. Pricing must stay editable and AI must not invent final prices.

Acceptance Criteria

- Given I am on a job site, when I create a site note and speak the job details, then the app saves a transcript linked to the customer/job.
- Given the transcript is saved, when I tap Generate Quote Draft, then Gemini creates a scope of work and editable line items.
- Given the quote draft is generated, when pricing is missing, then the app clearly marks pricing as needs review.
- Given I review the quote, when I approve it, then I can copy, share, or export it without retyping the whole job.

Business Value

Faster quote creation, fewer forgotten details, better customer response time, and higher chance of quote conversion.

Priority Score

Factor	Score / 5
User pain severity	5
Frequency	5
Willingness to pay	4
MVP fit	5
Market size relevance	5
Technical complexity	3

Overall Priority: High

Confidence Level: High

Further Validation Needed: Watch 5 tradies use voice capture after a real job and see whether they trust the quote draft enough to edit/send.

Risks / Adoption Barriers

- Noisy sites may reduce transcript quality.
- AI wording may feel too polished or generic.
- Quote pricing automation should be avoided until validated.

2. Missed call to callback task and SMS suggestion

As a solo electrician, I want to log a missed call and generate a quick callback message, so that I do not lose a job while I am on the tools.

User Persona

Persona Field	Details
Trade type	Electrician
Business size	Solo or 1 apprentice
Location / context	Melbourne metro, jobs in homes and small businesses
Daily workflow	On ladders, in roof spaces, using tools, and often unable to answer calls
Admin / tech comfort	Uses phone heavily but does not want a CRM
Current pain point	Missed calls become forgotten callbacks

Problem Being Solved

The real issue is lead leakage. A missed call may be a new customer, a quote follow-up, or an urgent issue. The tradie may intend to call back but forgets once the next job starts.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	The supplied business context identifies missed calls as a core ICP problem. ServiceM8 Phone-style products also validate call handling as a trade/service workflow category.
Reasonable inference	Missed-call recovery is commercially meaningful because enquiries are often phone-led and timing-sensitive.
Unvalidated assumption	A manual missed-call helper is enough before automated AI phone answering.

Current Workaround

Voicemail, call log, SMS manually, missed-call auto-text apps, admin assistant, or nothing.

MVP Feature Connection

Do not build full AI phone answering yet. Build manual missed-call logging: enter/select caller, generate SMS, create callback task.

Acceptance Criteria

- Given I missed a call, when I enter the number or select an existing customer, then the app creates a missed-call record.
- Given the missed call is logged, when I tap Draft Reply, then the app generates a short callback SMS.
- Given I approve the SMS, when I copy or send it manually, then the app logs the follow-up action.
- Given the callback is not completed, when it is overdue, then it appears on the daily admin summary.

Business Value

Captures more enquiries, reduces forgotten callbacks, and creates a future path to AI phone handling.

Priority Score

Factor	Score / 5
User pain severity	5
Frequency	4
Willingness to pay	4
MVP fit	4
Market size relevance	5
Technical complexity	2

Overall Priority: High for manual MVP; Low for full AI phone agent

Confidence Level: Medium

Further Validation Needed: Ask 10 tradies how many calls they miss daily and whether they would trust auto-replies.

Risks / Adoption Barriers

- Automated calling is high-risk and should not be in MVP.
- Users may prefer existing phone/SMS auto-reply features.
- Push reminders may be ignored.

3. Quote follow-up reminder

As a small concreting business owner, I want reminders and message drafts for pending quotes, so that I can follow up before the customer goes cold.

User Persona

Persona Field	Details
Trade type	Concreter / driveway contractor
Business size	2-4 people
Location / context	Outer suburbs or regional growth areas
Daily workflow	Site visits, quoting, material planning, labour scheduling
Admin / tech comfort	Uses phone and spreadsheet; may use Xero for invoices
Current pain point	Quotes are sent but not followed up consistently

Problem Being Solved

The problem is lost revenue from weak follow-up discipline. Many quote opportunities require a polite second touch. The tradie may be busy, forget the quote, or feel awkward chasing.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Established trade platforms include quote-to-job workflows, customer communication, and quote tracking.
Reasonable inference	Quote follow-up is part of the validated field-service/admin workflow category.
Unvalidated assumption	AI-generated follow-up wording is better than a simple template.

Current Workaround

Memory, calendar reminder, SMS, Excel quote tracker, Xero quote status, Tradify/ServiceM8 if already adopted, or no follow-up.

MVP Feature Connection

Add follow-up due date, quote status, and Gemini-generated follow-up message. Do not build a complex sales pipeline yet.

Acceptance Criteria

- Given a quote is created, when I set a follow-up date, then it appears in the dashboard when due.
- Given a quote follow-up is due, when I tap Draft Follow-Up, then the app creates an editable SMS/email.
- Given I mark the follow-up as done, then the quote follow-up status updates.
- Given the quote is accepted or declined, then the app stops follow-up reminders for that quote.

Business Value

Improves quote response speed, increases conversion opportunities, and creates a strong ROI story.

Priority Score

Factor	Score / 5
User pain severity	4

Factor	Score / 5
Frequency	5
Willingness to pay	4
MVP fit	5
Market size relevance	5
Technical complexity	2

Overall Priority: High

Confidence Level: High

Further Validation Needed: Beta users should tag every quote and report whether follow-ups helped get responses.

Risks / Adoption Barriers

- Users may not record quote status manually.
- Some may already use Xero/ServiceM8 reminders.
- Follow-up tone needs to sound local and not robotic.

4. Invoice follow-up message

As a small trade business owner, I want the app to draft polite invoice reminders, so that I can chase payment without sounding awkward or aggressive.

User Persona

Persona Field	Details
Trade type	General maintenance / handyman / small builder
Business size	1-5 people
Location / context	Australian suburbs, mixed residential and small commercial clients
Daily workflow	Completes jobs, sends invoices, follows up when cash gets tight
Admin / tech comfort	Uses Xero/MYOB/QuickBooks or accountant; does not love admin
Current pain point	Payment chasing happens late or inconsistently

Problem Being Solved

This is a cash-flow problem, not just a messaging problem. Chasing money is uncomfortable, so it gets delayed.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Xero reports Australian small-business invoices are still paid late on average. AMP research reports financial admin as a major burden for small business owners.
Reasonable inference	Small tradies benefit from easier invoice chasing even if they already use accounting software.
Unvalidated assumption	Users will manually track invoice status inside this MVP before accounting integrations exist.

Current Workaround

Xero/MYOB invoice reminders, manual SMS, phone calls, email, bookkeeper, accountant, spreadsheet, or waiting until overdue.

MVP Feature Connection

Add simple invoice tracker: amount, due date, status, reminder count. Gemini drafts reminders, but user approves before sending.

Acceptance Criteria

- Given an invoice is unpaid, when the due date arrives, then it appears in the dashboard.
- Given I tap Draft Reminder, then the app generates a polite payment reminder using customer, amount, and due date.
- Given an invoice is overdue multiple times, when I generate another reminder, then the wording becomes firmer but still professional.
- Given I mark the invoice as paid, then reminders stop.

Business Value

Improves payment collection, reduces admin stress, and has obvious willingness-to-pay potential.

Priority Score

Factor	Score / 5
User pain severity	5
Frequency	4
Willingness to pay	5
MVP fit	4
Market size relevance	5
Technical complexity	2

Overall Priority: High

Confidence Level: High for pain; Medium for MVP fit without accounting integration

Further Validation Needed: Ask whether users are willing to enter invoice due dates manually or only want Xero/MYOB sync.

Risks / Adoption Barriers

- Manual invoice entry may be annoying.
- Users may already rely on Xero automatic reminders.
- Payment reminder wording needs to avoid legal or aggressive language.

5. Site report from voice note and photos

As a property maintenance tradie, I want to turn site photos and a voice note into a clean report, so that I can update landlords, agents, or clients without typing a long explanation.

User Persona

Persona Field	Details
Trade type	Property maintenance plumber / electrician / handyman
Business size	Solo or 2-person team
Location / context	Works with property managers, landlords, real estate agents
Daily workflow	Attends multiple small jobs, takes photos, explains findings
Admin / tech comfort	Uses photos and SMS; reports are painful
Current pain point	Customer updates are scattered and time-consuming

Problem Being Solved

The real need is evidence-based communication. The customer is not on site. The tradie needs to explain what happened, what was found, what is recommended, and what happens next.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Field-service platforms treat job notes, photos, client communication, and reports/forms as core operational data.
Reasonable inference	Reporting is more important for property maintenance and commercial/client-managed work than for simple one-off residential jobs.
Unvalidated assumption	Users will pay specifically for reports before quote/invoice workflows are proven.

Current Workaround

Send photos via SMS, voice memo to admin, handwritten notes, email typed at night, or no formal report.

MVP Feature Connection

Use photos + transcript -> Gemini customer report. Improve this rather than adding unrelated features.

Acceptance Criteria

- Given I upload photos to a site note, when I generate a report, then the app includes photo references and plain-English findings.
- Given the AI report is generated, when key details are missing, then the app flags what needs user review.
- Given I approve the report, when I share or export it, then the customer receives a clean written update.
- Given the report is linked to a job/customer, then I can find it later.

Business Value

Saves admin time, improves professionalism, supports property-manager workflows, and reduces disputes.

Priority Score

Factor	Score / 5
User pain severity	4
Frequency	3
Willingness to pay	4
MVP fit	5
Market size relevance	4
Technical complexity	3

Overall Priority: Medium-High

Confidence Level: Medium

Further Validation Needed: Test with property-maintenance tradies and ask whether reports are frequent enough to matter weekly.

Risks / Adoption Barriers

- Photo handling adds storage and privacy considerations.
- Reports may be less frequent for pure residential callout jobs.
- AI must not overstate findings.

6. Daily admin summary for the owner

As a trade business owner, I want a daily admin summary showing overdue tasks, quotes, invoices, and missed calls, so that I know what needs action before the day gets away from me.

User Persona

Persona Field	Details
Trade type	Mixed small trade business owner
Business size	2-5 people
Location / context	Australian metro or regional business
Daily workflow	Starts early, checks jobs, workers, materials, customers, then goes on-site
Admin / tech comfort	Moderate; willing to use simple dashboards
Current pain point	Admin is spread across phone, emails, texts, accounting software, and memory

Problem Being Solved

The owner does not need another fancy dashboard. They need a simple what-do-I-need-to-do-today list.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	AMP research reports that admin time gets in the way of running the business for many small business owners.
Reasonable inference	A daily summary can reduce admin overwhelm if it is short, action-based, and mobile-first.
Unvalidated assumption	Users will open the app daily without push/email reminders.

Current Workaround

Mental checklist, whiteboard, calendar, texts from partner/admin, sticky notes, inbox, job-management dashboard if already using one.

MVP Feature Connection

Use dashboard summary from the Replit MVP and expand it with tasks, quotes, reports, invoice reminders, and missed-call records.

Acceptance Criteria

- Given I open the dashboard, when there are overdue actions, then I see the top actions first.
- Given I have quotes due for follow-up, then they appear with one-tap message drafting.
- Given I have invoices overdue, then they appear with one-tap reminder drafting.
- Given all admin is clear, then the dashboard shows a simple up-to-date state.

Business Value

Improves retention because the app becomes a daily habit. Helps users feel control, not just generate documents.

Priority Score

Factor	Score / 5
User pain severity	4

Factor	Score / 5
Frequency	5
Willingness to pay	3
MVP fit	5
Market size relevance	5
Technical complexity	2

Overall Priority: High

Confidence Level: Medium-High

Further Validation Needed: Track whether beta users open the dashboard 3+ times per week.

Risks / Adoption Barriers

- Dashboard may become noisy if too many actions appear.
- Users may need reminders to return.
- Summary must stay simple and blunt.

7. Admin partner turning site notes into tasks

As the partner or admin helper of a small trade business, I want the tradie's voice notes turned into clear tasks, so that I can help with admin without asking them to explain everything again.

User Persona

Persona Field	Details
Trade type	Plumbing/electrical/carpentry business
Business size	2-5 people
Location / context	Owner on-site; partner/admin at home or part-time office
Daily workflow	Tradie does site work; partner/admin helps with quotes, bookings, invoices, messages
Admin / tech comfort	Higher than tradie; uses laptop and phone
Current pain point	The admin helper lacks job context

Problem Being Solved

Small trade admin often depends on the owner's memory. The admin helper cannot follow up properly if the job details are trapped in the tradie's head.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Field/office separation is already visible in established trade software: field staff use mobile apps while office staff access dashboards.
Reasonable inference	The admin partner may become a power user even if the tradie is the buyer.
Unvalidated assumption	These businesses will invite another user into the MVP early.

Current Workaround

Voice messages, calls at night, photos, texts, shared notes, spreadsheets, or the admin person chasing the owner for context.

MVP Feature Connection

Add team/admin access after single-user MVP is working. In the first version, simulate by letting owner share summaries/tasks.

Acceptance Criteria

- Given a voice note is created, when AI processes it, then it produces clear tasks and missing-info flags.
- Given an admin helper opens the job, then they can see the summary, tasks, customer details, and follow-up status.
- Given a task is assigned to admin, when completed, then the owner can see it is done.
- Given information is missing, then the app shows questions to ask the tradie.

Business Value

Expands use case beyond solo tradie, increases retention, and makes the product useful to the person actually doing admin.

Priority Score

Factor	Score / 5
User pain severity	4
Frequency	4
Willingness to pay	4
MVP fit	3
Market size relevance	4
Technical complexity	3

Overall Priority: Medium-High

Confidence Level: Medium

Further Validation Needed: Interview spouses/admin helpers, not just tradies.

Risks / Adoption Barriers

- Permissions add complexity.
- The buyer and daily user may be different people.
- Data privacy becomes more important with shared access.

8. Simple job tracking for small teams

As a small carpentry team owner, I want to track job status and next actions, so that jobs do not slip through the cracks when multiple people are involved.

User Persona

Persona Field	Details
Trade type	Carpenter / small renovation contractor
Business size	3-5 people
Location / context	Residential renovation jobs, multiple active sites
Daily workflow	Owner quotes, coordinates materials, workers, customer changes, site progress
Admin / tech comfort	Moderate; may resist heavy project-management software
Current pain point	Jobs progress informally through texts and memory

Problem Being Solved

This is not full project management. It is basic operational visibility: who is waiting on what, what has been promised, what needs follow-up.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	AroFlo, ServiceM8, and Tradify all position job management as a core category for trade/service businesses.
Reasonable inference	Small teams need lightweight job tracking before complex scheduling.
Unvalidated assumption	A simple MVP job tracker is enough for renovation/building workflows, which can become complex.

Current Workaround

Group chats, whiteboard, Google Calendar, Excel, paper folder, ServiceM8/Tradify/AroFlo if already adopted.

MVP Feature Connection

Formalise Jobs as the parent object: customer, address, status, next action, linked notes, quotes, reports, invoices.

Acceptance Criteria

- Given I create a job, when I add notes/tasks/quotes, then they stay linked to that job.
- Given a job has a next action, then it appears on the dashboard.
- Given a task is overdue, then the job status shows attention needed.
- Given I search a customer, then I can see their job history.

Business Value

Reduces lost admin, improves customer experience, and supports growth from solo to small team.

Priority Score

Factor	Score / 5
User pain severity	4

Factor	Score / 5
Frequency	4
Willingness to pay	4
MVP fit	4
Market size relevance	5
Technical complexity	3

Overall Priority: Medium-High

Confidence Level: Medium

Further Validation Needed: Determine whether first users are mostly callout tradies or project-based contractors; workflows differ.

Risks / Adoption Barriers

- Can easily become overbuilt project management.
- Small teams may already have group chats they prefer.
- Construction/renovation workflows can be more complex than MVP allows.

9. Customer message drafting after job completion

As a residential handyman, I want the app to draft clear customer update messages after a job, so that I can communicate professionally without spending time writing.

User Persona

Persona Field	Details
Trade type	Handyman / property maintenance contractor
Business size	Solo
Location / context	Suburban jobs, many small tasks per week
Daily workflow	Several jobs per day, customer updates via SMS
Admin / tech comfort	Comfortable with SMS; not interested in complex CRM
Current pain point	Customer communication is repetitive and done while tired

Problem Being Solved

The pain is small-message fatigue. I have finished, here is what I found, here is what needs doing next, please approve this, and please pay are repetitive but important.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Trade platforms include client emails/texts, job notes/photos, online bookings, invoicing, and payments.
Reasonable inference	Drafting repetitive customer messages is a useful, low-risk Gemini use case.
Unvalidated assumption	Users will prefer AI drafts over fixed message templates.

Current Workaround

Manual SMS, saved phone text replacement, notes app templates, copy-paste from old messages, or no update unless customer asks.

MVP Feature Connection

Use Gemini for editable message drafts based on job note/report/task status. Start with copy/share, not direct SMS sending.

Acceptance Criteria

- Given a job has a completed task or site note, when I tap Draft Customer Update, then the app generates a short SMS.
- Given the draft contains uncertain information, then it flags it for review.
- Given I edit the draft, when I copy or share it, then the message is logged.
- Given I later open the customer record, then I can see message history.

Business Value

Improves customer experience, makes small operators look more professional, and drives repeat usage.

Priority Score

Factor	Score / 5
User pain severity	3
Frequency	5
Willingness to pay	3
MVP fit	5
Market size relevance	5
Technical complexity	2

Overall Priority: Medium-High

Confidence Level: Medium

Further Validation Needed: Compare AI drafts versus fixed templates in prototype tests.

Risks / Adoption Barriers

- AI messages may feel fake if tone is wrong.
- Templates might be enough.
- Direct SMS sending should wait until users prove they copy/send drafts.

10. Booking confirmation from a site note

As a small HVAC contractor, I want to generate a booking confirmation message from a job note, so that customers know when I am coming and what to expect.

User Persona

Persona Field	Details
Trade type	HVAC technician / aircon service contractor
Business size	1-3 people
Location / context	Summer peak demand, multiple bookings per day
Daily workflow	Inspections, service calls, urgent breakdowns, seasonal spikes
Admin / tech comfort	Uses calendar, phone, SMS; may not use full field-service platform
Current pain point	Customers need confirmations, but sending them manually adds friction

Problem Being Solved

The real problem is coordination friction. Customers want confirmation; tradies want fewer back-and-forth messages.

Market Need Validation

Evidence Type	Notes
Confirmed evidence	Field-service software commonly includes scheduling, online bookings, job cards, notifications, and customer communication.
Reasonable inference	Booking confirmation is useful for tradies with repeat appointments or seasonal demand.
Unvalidated assumption	MVP users need booking workflow before quote/invoice follow-ups.

Current Workaround

Manual SMS, Google Calendar invite, phone call, voicemail, receptionist/admin helper, ServiceM8/Tradify/AroFlo.

MVP Feature Connection

The Replit MVP includes booking messages. Keep this as a lightweight message generator, not full calendar scheduling yet.

Acceptance Criteria

- Given a job has a scheduled date/time, when I tap Draft Booking Confirmation, then the app generates a customer-ready message.
- Given the message is generated, then it includes date, time window, address, and any prep instructions.
- Given booking details are missing, then the app asks for the missing fields before generating.
- Given I copy or share the message, then it is logged under that job.

Business Value

Reduces back-and-forth, improves customer experience, and makes the business feel more organised.

Priority Score

Factor	Score / 5
User pain severity	3
Frequency	4
Willingness to pay	3
MVP fit	4
Market size relevance	4
Technical complexity	2

Overall Priority: Medium

Confidence Level: Medium

Further Validation Needed: Find whether booking confirmations are more painful than quote and invoice follow-ups for first beta users.

Risks / Adoption Barriers

- Not every trade has heavy booking-confirmation needs.
- Full scheduling is a rabbit hole.
- Calendar integrations should wait.

Strategic Summary

Top 3 Strongest Opportunities

- Voice note -> quote/task/admin output. This is the clearest wedge because it matches the Replit MVP, brand direction, and field-first positioning.
- Quote and invoice follow-up reminders. These connect directly to revenue and cash flow, not just convenience.
- Daily admin summary. This can become the retention loop by answering: what do I need to do today?

Top 3 Riskiest Assumptions

- Tradies will use a standalone app weekly. They might say they like it, then return to SMS, notes, and memory.
- Voice-first is the preferred input. Voice is logical, but job sites are noisy and users may feel awkward speaking detailed notes.
- AI messaging is trusted enough to use. Output must sound like a real Australian trade business, not corporate fluff.

Features That Should Be Built First

- Firebase Auth + business setup
- Customers + Jobs
- New Site Note with transcript and photos
- Gemini summary from voice/text note
- AI task extraction
- Quote follow-up draft
- Invoice follow-up draft
- Missed-call manual log + callback SMS draft
- Daily admin summary
- Basic analytics and feedback button

Features That Should Not Be Built Yet

- Full AI phone answering
- Fully automated SMS sending without review
- Native iOS/Android apps
- Xero/MYOB deep sync
- Supplier integrations
- Full project management
- Automatic job pricing
- Customer portal
- Marketplace
- Complex team permissions

Recommended 30-Day Validation Plan

Week	Validation Activity	Success Signal
Week 1	Interview and observe 10 tradies from personal network. Target plumbers, electricians, maintenance contractors, and small builders first.	They can show the current workflow and name one painful admin job they would pay to reduce.
Week 2	Prototype test with 5 tradies using the PWA after real jobs.	Each active user creates at least 3 real site notes in one week.
Week 3	Test quote and invoice reminders. Track whether they copy/send drafts.	Users actually send or copy AI-drafted follow-ups, not just say they like them.
Week 4	Run willingness-to-pay test at \$29, \$49, \$79, \$99 per month.	At least 3-5 users show serious willingness to pay or ask to keep using it.

Questions to Ask Real Tradies Before Building Further

- How many quotes did you send last week?
- How many quotes did you forget to follow up?
- How do you currently capture job details on-site?
- Do you use voice notes, photos, SMS, paper, or memory?
- What admin do you usually do after 6pm?
- How many calls do you miss on a normal workday?
- What happens when you miss a call?
- What accounting/job software do you already use?
- What do you hate about your current software?
- Would you trust AI to draft a customer message if you review it first?
- Would you trust AI to price a quote?
- Who actually does your admin - you, partner, bookkeeper, or admin staff?
- What would save you one hour this week?
- What would make this worth \$49/month?
- What would make you cancel after one week?

Final Recommendation

The strongest MVP is not AI for tradies. It is: speak once, clear your admin faster. Validate that workflow first. Full AI phone answering, native apps, deep accounting sync, and automatic pricing should wait until real weekly usage and willingness to pay are proven.
